SHIP A LANDING PAGE WITH V0 AND VERCEL

By Emmanuel Apilado | October 2026

Introducing Today's Project!

In this project, I'm going to build a landing page without writing code from scratch: describe what I want in plain English and let v0.dev generate the code and depoy it to Vercel with one click.

Key tools and concepts

The key tools I used include my Vercel as the main tool and this is the deployment environment, v0.dev where we generate code using React/Tailwind CSS and my GitHub account as my source code repo where code from v0 was exported from. Key concepts I learnt are how easy it is to deploy a website using these 3 tools by just prompting plain english as to what you want for your website.

Challenges and wins

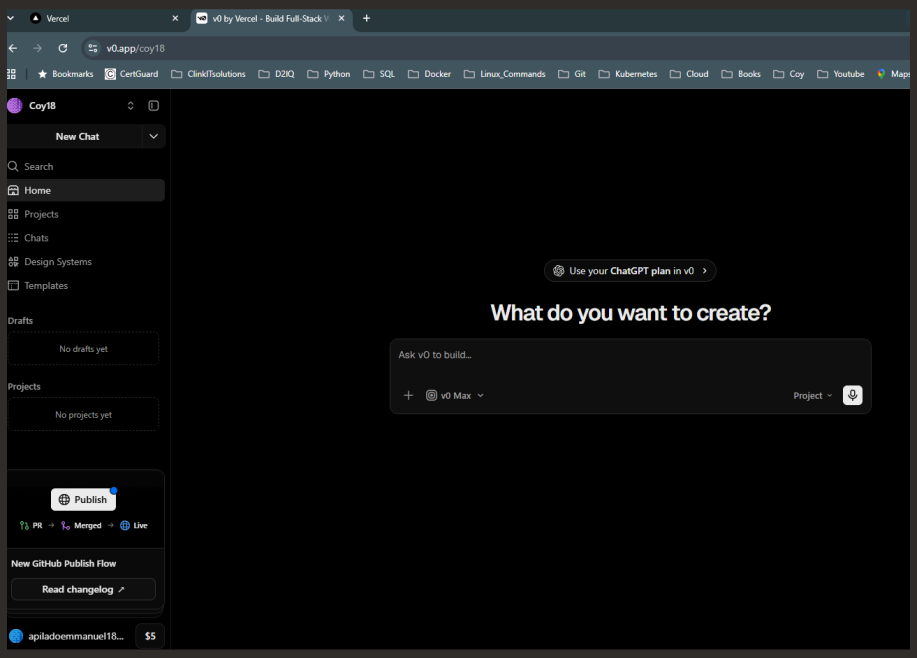

This project took me approximately 1hour due to navigation familiarity of the v0 and Vercel tools. The most challenging part was nothing really and it was fun to explore those tools. It was most rewarding to see my ecommerce landing page come to life in just a few mins and then make iterations that took only minutes as well.

Project Reflection

I did this project today to learn how to use Vercel and v0 and integrate my GitHub account. Another skill I want to learn is build a whole team of AI specialists that each handle a different part of the job.

Setting Up v0 and Vercel

In this step, I'm going to create a Vercel account and link it to my GitHub account (the most important part). I need a Vercel account because this is the tool I need to deploy my landing page. I need Vercel account because v0.dev which I'll use to generate the code for my landing page, is part of the Vercel ecosystem which requires a Vercel account to sign in.

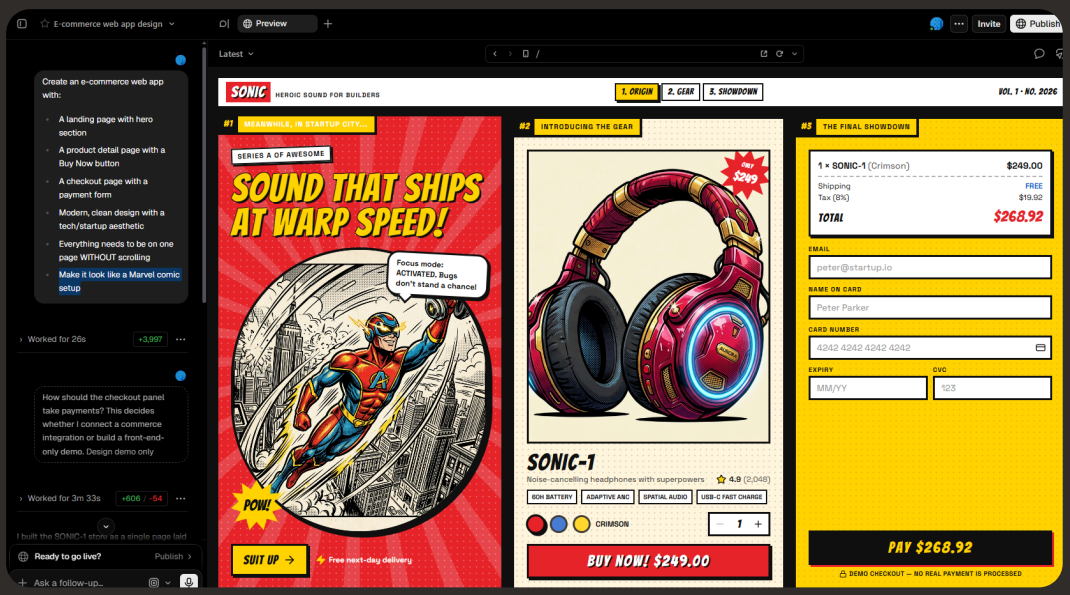

Connecting v0.dev to Vercel

I signed into v0.dev using the same email as I used with signing up for Vercel with my GitHub account. v0.dev automatically integrates with my GitHub account where my GitHub account is what I used to sign up for Vercel.

Generating an E-Commerce App with AI

In this step, I'm going to use v0.dev to generate a landing page, create product and checkout pages and customize our design with prompt iteration.

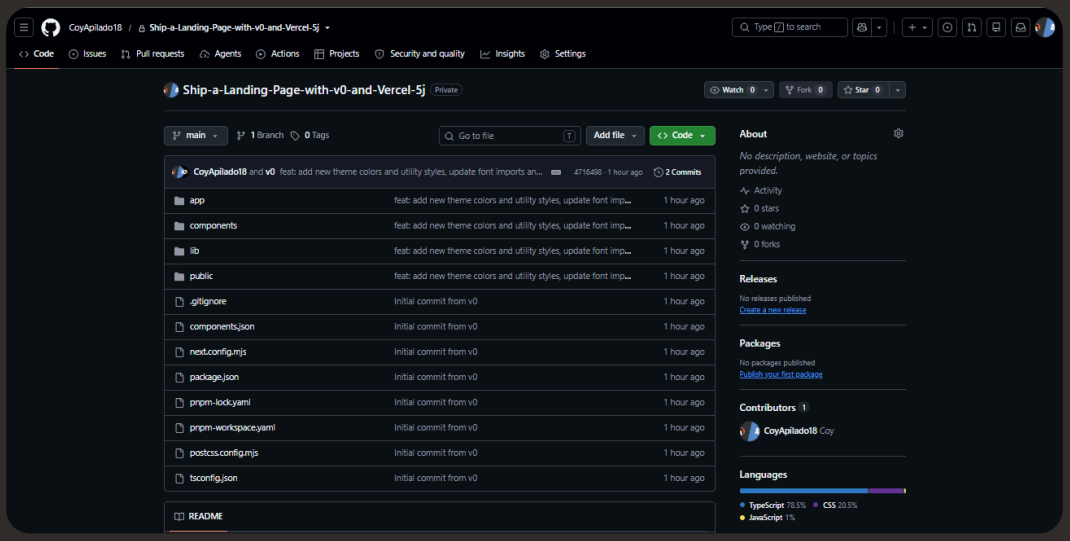

The AI-generated design

v0 generated a Marvel comic setup, like a comic book as exactly as I wanted. The pages include exactly what I specified in these prompt:
Create an e-commerce web app with:
- A landing page with hero section
- A product detail page with a Buy Now button
- A checkout page with a payment form
- Modern, clean design with a tech/startup aesthetic
- Everything needs to be on one page WITHOUT scrolling
- Make it look like a Marvel comic setup

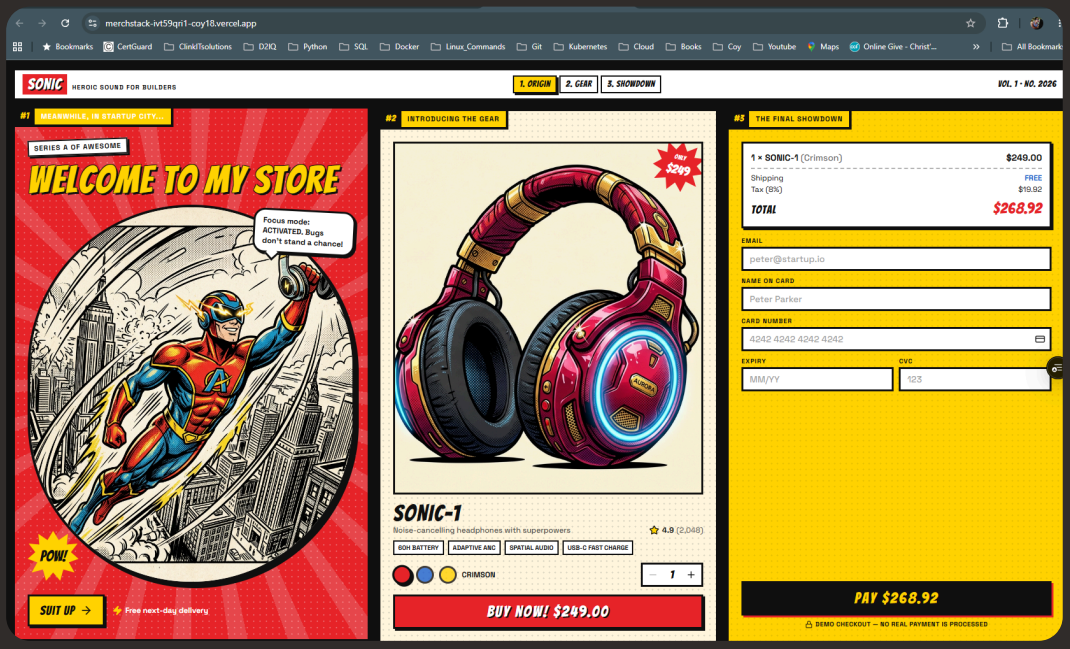

Publishing a Live Site with Vercel

In this step, I'm going to "go-live" with my ecommerce-app with one-click deploy. I will export my v0 project to my GitHub account, deploy to Vercel with one click and access our live site with HTTPS.

Exporting to GitHub

I exported my v0 project to GitHub by Publish button on the top right corner - GitHub - Create New Repo and the code is exported and stored in my GitHub repository named Ship-a-Landing-Page-with-v0-and-Vercel.

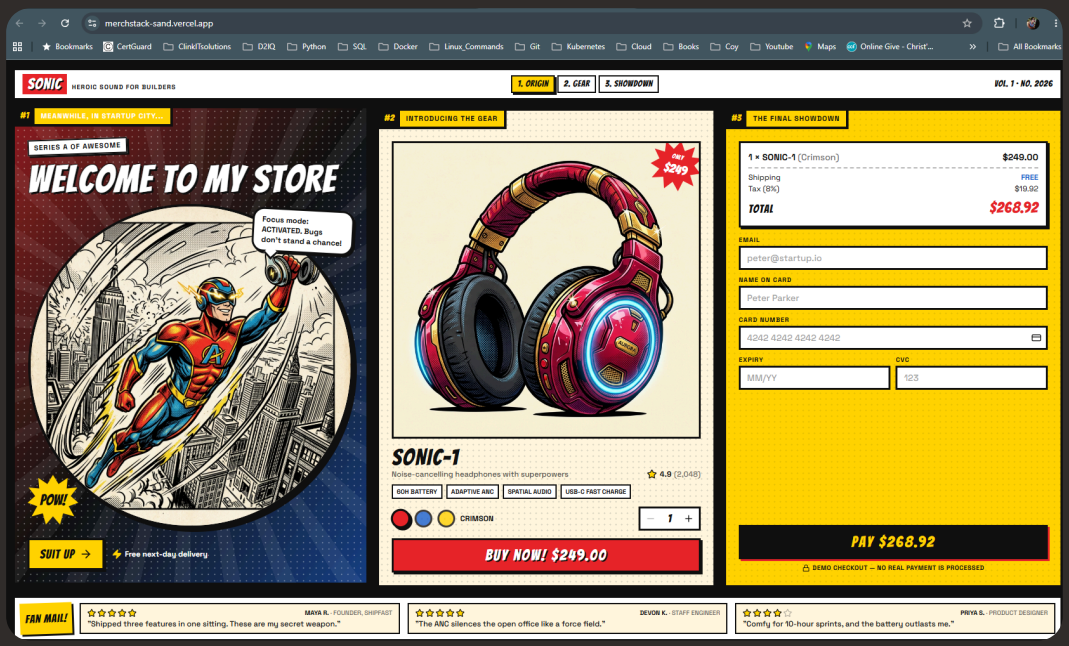

Vercel's built-in security

Vercel handles HTTPS for encrypted connections, CDN for global edge caching, DDoS protection and continuous deployment which means that every push to the main branch it auto-deploys.

Iterating on Your v0 Prompt

In this secret mission, I'm going to:
- Review my live site and identify two improvements.
- Send a follow-up prompt in v0 with my changes.
- Merge my PR and see Vercel auto-deploy.

Prompt engineering for better designs

I changed the current design by prompting v0 of the following:

1. Visual design change: e.g. Change the hero background to dark with white text and a gradient overlay

2. Add this feature: e.g. Add a customer testimonials section below the products with star ratings

Keep the existing styling approach. Make minimal, focused changes.

The changes looks better as the white text appears more visual with the dark background and the testimonials feature are great so that customer feedback/reviews our open to the public.
